

ABSTRACT OF THE DISCLOSURE

A low friction hanger system for reducing the lateral force required to move a hanger on a rod. The system includes a friction reducing element located between a hanger hook of the hanger and a supporting rod. The friction reducing element can include a roller or low friction material either integral with the hanger hook or retrofitted thereto. The friction reducing element can also include low friction material on the rod which is either integral therewith or retrofitted thereto. Optionally, lateral forced displacement magnets or laterally extending arms will aid in the lateral displacement the hanger relative to other hangers.
